

EICEPPMU Project summary

The project will theoretically and practically substantiate the need to implement in Ukraine the national concept – EU Module – of environmental security of society and the inclusion of a circular economy in a post-war & post pandemic time. Enhancing circularity can be part of policy response to systemic crises, such as climate change and post-pandemic recovery, in particular COVID-19 by providing circular system solutions for sustainable growth and economic recovery. With growing global consumption and growing pressure on resources, there is an urgent need to unbundle the growth economy from resource use and increasing Europe's resilience to the uncertainty of raw material supply and increasing the security of value chains. A sustainable, renewable, inclusive and equitable circular economy can significantly help our economy come to terms with the limitations and borders of our planet by restoring natural systems, reducing greenhouse gas emissions and minimizing the loss of natural capital and biodiversity. In addition, environmental policy is combined with social justice through an inclusive and equitable transition that ensures environmental sustainability, jobs and social inclusion, creating the foundations for inclusive environmental security mostly in a post-war & post pandemic time. This project will deep our previous projects: 2021 “Environmental security of European society and the inclusion of a circular economy under pandemic” and 2020 “EU circular economy benchmarking”. Now Ukraine is in war with Russia, so, we strongly need to implement European values and experience for all participants of the project and other target groups.
